TOOLPLANE / ERPBRIDGE

ERPBridge Evaluation Report

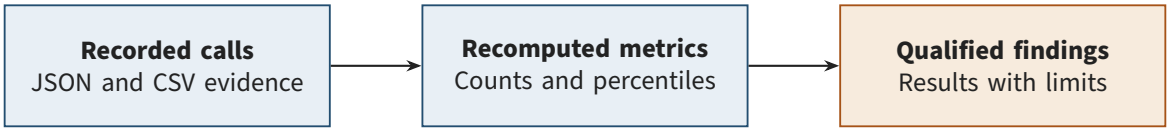
Integration evidence, read performance, governance checks, and evaluation limits

Evidence review edition | 19 October 2026

100/100
Demo read calls
One short burst workload

361 ms
Median latency
Client-observed, nearest rank

662 ms
p95 latency
Client-observed, nearest rank



What the evidence supports
Integration feasibility, selected boundary behavior, and a bounded read-latency observation.

Interpretation limit
This is not a release certification, a maximum-capacity benchmark, or proof of production reliability. Historical run-to-binary attribution is unknown; the separate demo target version was not recorded.

Prepared from the supplied evidence archive. No new live benchmark or model trial was run to produce this report.

DESIGN SPECIMEN

Results, diagrams, and evidence

This specimen checks the title plate, serif narrative, sans-serif labels, tables, figures, source notes, and recorded-output typography before the full report is generated.

Recorded, not generalized
The demo run reports 100 successful read calls. It does not establish a sustainable throughput limit.

Table 1. Specimen result table

Metric	Value	Unit
Median	361	ms
p95	662	ms

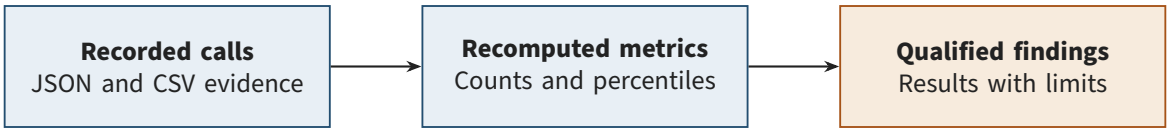


Figure 1. Evidence transformation, not a runtime architecture diagram.

Source: Supplied performance JSON; diagram is an editorial evidence model.

```
{"batch": 1, "tool": "list_items", "ms": 628, "ok": true}
```

Interpretation limit
Copy checks and numerical consistency checks do not establish the identity of the deployed binary.
